

ABSTRACT OF THE DISCLOSURE

Supposing an information processing system having a server which receives a request of service via a transmission line or a network and provides the service, the server receives from a client address information such as an instruction address in an address space of the client to thereby provide the client with service corresponding to the address information, instead of calling a program of the server from the client. By adopting this protocol, the communication processing between the server and the client is simple. Furthermore, the cost reduction of the data processing system for providing a client or an information terminal apparatus with service via the network or the like can also be implemented.
